Web technologies

Put Request

```
angular module ('my APP', [])
controller ('Mycontroller', (' $scope', '$http', function,
$scope, $http){
    $scope. function formData = {},

    $scope. put formData = function(){
    $http. put ('/api/data/'+ $scope. formData id,
    $scope. formData)
        .then (function (response){
        console. log (response){

    });
    . catch ( function (error) {
    console . log (response){
    });
    });
    });
```

Explaination :-

→ The ng submit directive calls the Put form Data()
function when the form is submitted.
→ The PutformData() function sends a Put request
to the (api/data/:id endpoint with the ID
as a Part Parameter and the term form the data
as the request body.
